#Volcono plot
  plot( res$log2FoldChange, -log(res$padj) )
```

Q. Improve this plot by completing the below code, which adds color and axis labels

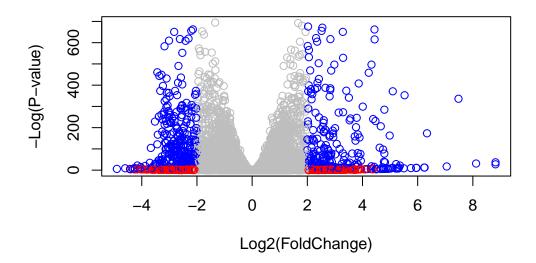

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

# Color blue those with adjusted p-value less than 0.01

# and absolute fold change more than 2
inds <- (res$padj<0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

plot( res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(mycols)"</pre>
```

Q. Use the mapIDs() function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by completing the code below.

```
library("AnnotationDbi")
library("org.Hs.eg.db")
```

```
columns(org.Hs.eg.db)
 [1] "ACCNUM"
                    "ALIAS"
 [6] "ENTREZID"

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

The pathway that has the most significant "Entities p-value" is Endosomal/Vacuolar pathway. The most significant pathways listed do not match the previous KEGG results. Factors that could cause differences between the two methods are different algorithms and each algorithms have a different focus. Both KEGG and Reactome covers same number of genes. The difference is KEGG has more broad term and Reactome has similar terms but as multiple detailed entries.
